Fortran 77 : 4. Relational and Logic Operators

Relational operators in logical statements are used control the flow of code. In this document we simply consider the coding and results of relational operators. Logical statements can be linked together using logical operators.

Logical variables and values

Logical variables were first introduced in section 2 of this series. A logical variable can only take one of two values - true or false, written ‘.TRUE.’ and ‘.FALSE.’ in the Fortran language, but written as ‘T’ or ‘F’ when the value of a logical variable is output.

The following program and output demonstrates logical variables and values.

```fortran
C Logical
C *************
PROGRAM LOGVAR
LOGICAL YES,NO
YES=.TRUE.
NO=.FALSE.
WRITE(*,*) YES
WRITE(*,*) NO
STOP
END
```

Relational Operators

The following table lists the relational operators in Fortran and their meaning.

<table>
<thead>
<tr>
<th>Relational operator</th>
<th>Mathematical notation</th>
<th>Matlab/Freemat</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equal to</td>
<td>=</td>
<td>.EQ.</td>
</tr>
<tr>
<td>Greater than</td>
<td>&gt;</td>
<td>.GT.</td>
</tr>
<tr>
<td>Greater than or equal to</td>
<td>&gt;=</td>
<td>.GE.</td>
</tr>
<tr>
<td>Less than</td>
<td>&lt;</td>
<td>.LT.</td>
</tr>
<tr>
<td>Less than or equal to</td>
<td>=&lt;</td>
<td>.LE.</td>
</tr>
<tr>
<td>Not equal to</td>
<td>!=</td>
<td>.NE.</td>
</tr>
</tbody>
</table>

1 Fortran 77 : 2 Variables and Identifiers
In the following program the relational operators are used to compare 2 with 2 and then compare 2 with 3.

```
C ************
C Relational
C ************
    PROGRAM RELATIONAL
C Comparing 2 with 2
    WRITE(*,*) 2.EQ.2
    WRITE(*,*) 2.GT.2
    WRITE(*,*) 2.GE.2
    WRITE(*,*) 2.LT.2
    WRITE(*,*) 2.LE.2
    WRITE(*,*) 2.NE.2
C Comparing 2 with 3
    WRITE(*,*) 2.EQ.3
    WRITE(*,*) 2.GT.3
    WRITE(*,*) 2.GE.3
    WRITE(*,*) 2.LT.3
    WRITE(*,*) 2.LE.3
    WRITE(*,*) 2.NE.3
STOP
END
```

The output from the program is as follows.
Logical Operators

Logical operators act on or link logical statements to form new logical statements. There is one unary (meaning that it acts on only one operand) logical operator - NOT. The two main binary (meaning that it acts on two operands) logical operators – AND and OR.

NOT
If an operand evaluates to true (1) or false (0) the operator NOT has the following effect.

<table>
<thead>
<tr>
<th>operand</th>
<th>NOT operand</th>
</tr>
</thead>
<tbody>
<tr>
<td>T</td>
<td>F</td>
</tr>
<tr>
<td>F</td>
<td>T</td>
</tr>
</tbody>
</table>

In Fortran the NOT operator is represented by ‘NOT.’.

AND
If the two operands evaluate to true (T) or false (F) the operator AND has the following effect.

<table>
<thead>
<tr>
<th>operand</th>
<th>operand</th>
<th>operand AND operand</th>
</tr>
</thead>
<tbody>
<tr>
<td>T</td>
<td>T</td>
<td>T</td>
</tr>
<tr>
<td>T</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>F</td>
<td>T</td>
<td>F</td>
</tr>
<tr>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
</tbody>
</table>

In Fortran the AND operator is represented by ‘.AND.’.

OR
If the two operands evaluate to true (T) or false (F) the operator OR has the following effect.

<table>
<thead>
<tr>
<th>operand</th>
<th>operand</th>
<th>operand OR operand</th>
</tr>
</thead>
<tbody>
<tr>
<td>T</td>
<td>T</td>
<td>T</td>
</tr>
<tr>
<td>T</td>
<td>F</td>
<td>T</td>
</tr>
<tr>
<td>F</td>
<td>T</td>
<td>T</td>
</tr>
<tr>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
</tbody>
</table>

In Fortran the OR operator is represented by ‘.OR.’.
The following program and output demonstrate the logical operators in Fortran.

```fortran
C *************
C Logical
C *************

PROGRAM LOGICAL
WRITE(*,*) .NOT.(.TRUE.)
WRITE(*,*) .NOT.(.FALSE.)
WRITE(*,*)
WRITE(*,*) (.TRUE.).AND.(.TRUE.)
WRITE(*,*) (.TRUE.).AND.(.FALSE.)
WRITE(*,*) (.FALSE.).AND.(.TRUE.)
WRITE(*,*) (.FALSE.).AND.(.FALSE.)
write(*,*)
WRITE(*,*) (.TRUE.).OR.(.TRUE.)
WRITE(*,*) (.TRUE.).OR.(.FALSE.)
WRITE(*,*) (.FALSE.).OR.(.TRUE.)
WRITE(*,*) (.FALSE.).OR.(.FALSE.)
STOP
END
```

```
Plato IDE

Press RETURN to close window . . .
```
